🔹 **Project Details (Draft Outline)**

Title

Diabetes Prediction Web App – Powered by Machine Learning

Abstract (150–250 words)

- Briefly state the purpose: predicting diabetes risk using patient health data.
- Mention techniques: Multiple Logistic Regression, Random Forest, XGBoost.
- State evaluation metrics: Accuracy, Precision, Recall, F1 Score, ROC-AUC.
- Conclude with significance: how the web app can help early detection and preventive healthcare.

Introduction

- **Background**: Diabetes as a global health challenge, importance of early prediction.
- **Problem Importance**: Many undiagnosed cases; ML can help doctors and individuals with early detection.
- **Objectives**:
    1. Build machine learning models for diabetes prediction.
    2. Compare Logistic Regression, Random Forest, and XGBoost.
    3. Deploy a web app for real-time user predictions.

Methodology

1. **Data Source**
    - Use Pima Indians Diabetes Dataset (or similar dataset with health indicators like BMI, Glucose, Age, etc.).
2. **Preprocessing**
    - Handle missing values, normalization, and feature scaling.
    - Train-test split and cross-validation.
3. **Models to be Implemented**

    - **Multiple Logistic Regression** (baseline model).
    - **Random Forest Classifier**.
    - **XGBoost Classifier**.
4. **Evaluation Metrics**
    - Accuracy
    - Precision & Recall
    - F1 Score
    - ROC-AUC Curve
5. **Workflow / Architecture**
    - **Data Input → Preprocessing → Model Training → Evaluation → Deployment (Web App)**
    - Include workflow diagram in report.
6. **Deployment (Web App)**
    - Use **Flask / Streamlit / Gradio** for the web interface.
    - User enters values (glucose, BMI, etc.), model predicts diabetes risk.

Results & Discussion

- Present model comparison in tables and graphs.
- Example:
    - Logistic Regression → Accuracy ~75%
    - Random Forest → Accuracy ~80%
    - XGBoost → Accuracy ~83%
- Show **ROC curves** and **confusion matrices**.
- Discuss why ensemble models (RF, XGBoost) perform better.

Conclusion

- Summary of findings: XGBoost achieves the best balance of performance.
- Key contribution: Deployment of a user-friendly **web app** for diabetes prediction.
- Limitations: Dataset size, generalizability.
- Future work: Include larger datasets, integrate with wearable devices, real-time health monitoring.

References

- Cite research papers on ML in healthcare, diabetes datasets, and ML model comparisons.

◆ **Tools & Technologies You Should Use**

- **Programming Language**: Python
- **Libraries for ML**: Scikit-learn, XGBoost
- **Libraries for Data Analysis**: Pandas, NumPy
- **Visualization**: Matplotlib, Seaborn
- **Model Deployment**: Flask / Streamlit / Gradio
- **Evaluation**: sklearn.metrics (precision, recall, F1, ROC-AUC)
